PROBLEMS

- None of the available data sources capture the total number of clinical trials
- There is currently no single comprehensive source of data
- All clinical trials which have received ethics committee approval are required to be registered with a WHO primary registry; 18 per cent of all registered studies recruiting in New Zealand between 2006 and 2015 are registered on WHO primary registries other than the US and ANZ CTRs
- All figures reliant upon how users completed the register fields or ethics applications submissions
